One barrier. A thoughtful change. A useful handoff.

A phone-access barrier changes a workshop activity. The next facilitator receives the plan, its history, and the reason for the change.

0:00-0:25	**Frame the challenge**	Plan
0:25-1:00	**Make the reasoning teachable**	Plan
1:00-1:30	**Listen to an access barrier**	Listen
1:30-2:15	**Make and explain a choice**	Respond to feedback
2:15-2:50	**Show what changed**	Share
2:50-3:30	**Carry the learning forward**	Share, then imported Plan
3:30-4:00	**Close with the pilot question**	Imported Plan

Before you start

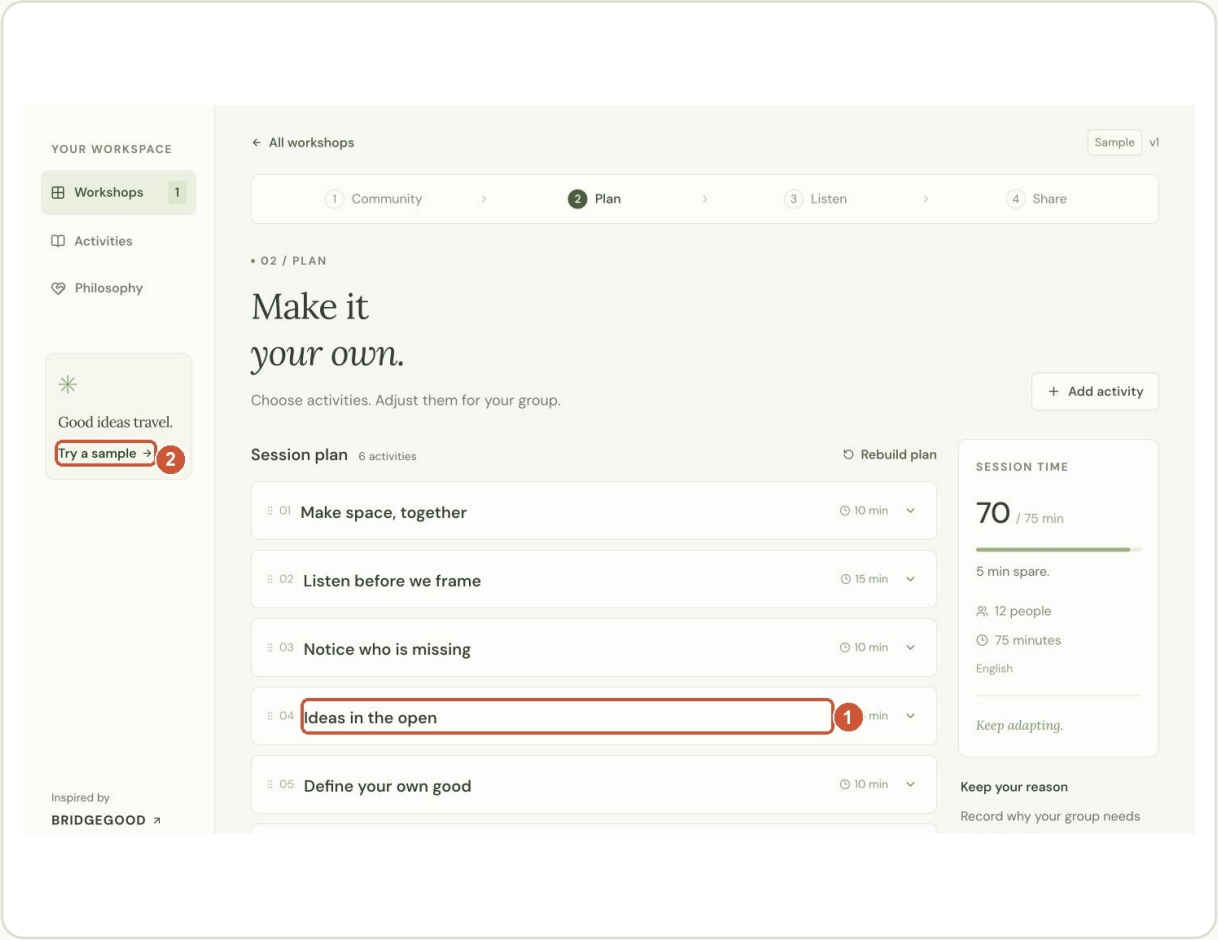

- Try a sample. Confirm v1, Ideas in the open, and open phone-data feedback.
- Copy the reason. Rehearse the download/import file picker once.
- Keep the sample context unchanged and have the local PDF/video ready.

Paste this reason

We're switching to paper and spoken contributions so everyone can take part without a reliable phone or data connection.

355 spoken words. Allow about 40-55 seconds for clicks and pauses. At 3:30, stop clicking and close.

Frame the challenge

1. Expand Ideas in the open
2. Try a sample before presenting

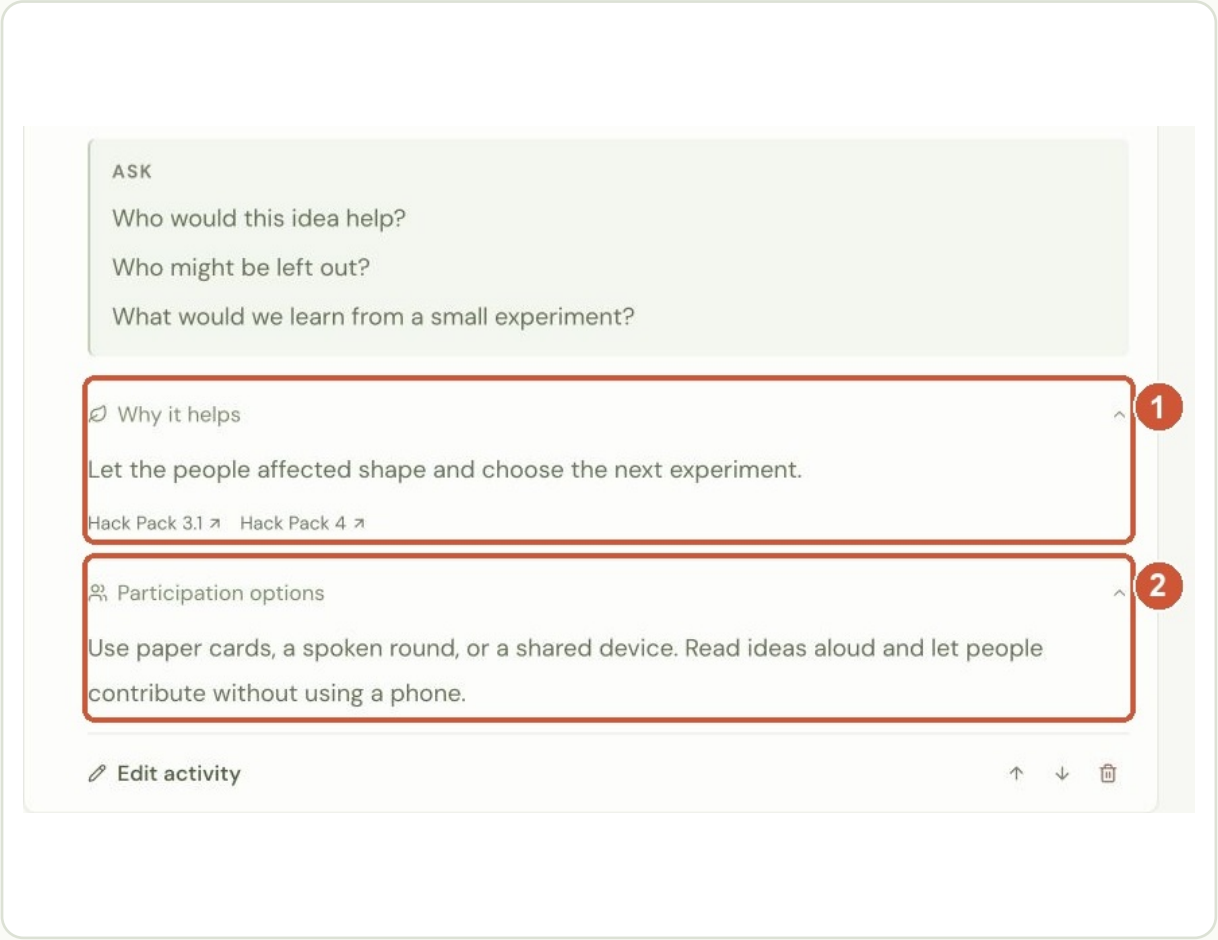

SAY

BRIDGEGOOD's Design for Social Good mindset grows through people, mentorship, and relationships. As the organization scales, that knowledge needs to travel beyond any one person. BridgeKit helps a facilitator practice the philosophy in a workshop, act on feedback, and pass the learning to the next community.

CLICK / POINT

- Begin inside the sample workshop on Plan, with v1 visible.
- Point to Ideas in the open. Keep the opening focused on the challenge.

Make the reasoning teachable

1. Reason + BRIDGEGOOD sources
2. Another way to participate

SAY

I'm starting with a fictional campus workshop. Each activity carries instructions, the reason behind them, a BRIDGEGOOD source, and another way to participate. The next facilitator can explain why the activity exists, then adapt it for the people in their room. That makes the philosophy practical and teachable.

CLICK / POINT

- Expand Ideas in the open.
- Scroll within the page and open Why it helps and Participation options.
- Point to the reason and Hack Pack source links. Keep source pages for Q&A.

Listen to an access barrier

1. Listen to the access barrier
2. Click Respond

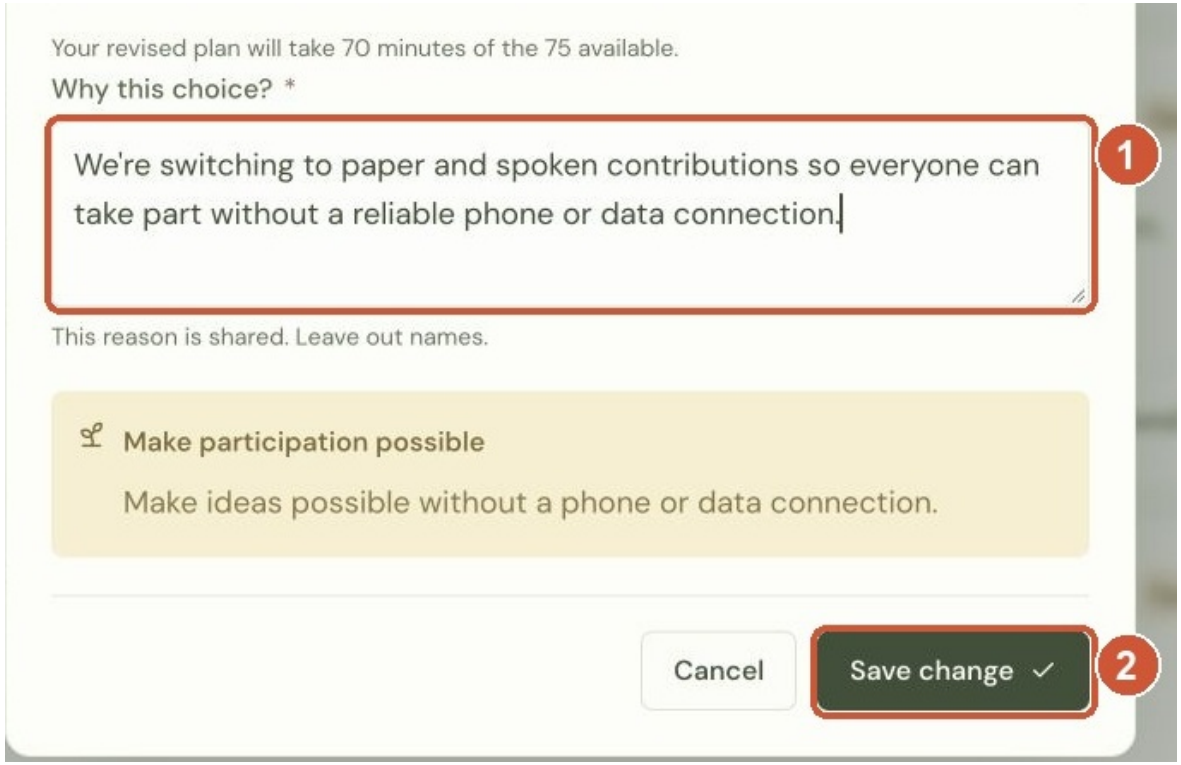

SAY

Now let's test the plan against the people using it. This demo feedback says the digital board was hard to join without a reliable phone or data connection. That is a concrete access barrier. I'll respond by deciding what needs to change.

CLICK / POINT

- Click Listen in the step bar, or Next: listen.
- Find the first Barrier card about phone or data access.
- Read its observation, then click Respond on that card.

Make and explain a choice

1. Explain why this serves the group
2. Click Save change

SAY

BridgeKit asks the facilitator to make a choice. I'm choosing Paper-first idea studio, where people can sketch, write, dictate, or speak without a phone. I'll record the reason: we are changing the format so everyone can contribute without reliable phone data. We could also keep an activity and explain why. The facilitator stays in control; the tool preserves the decision and its reasoning.

CLICK / POINT

- Review Change activity and Start from: Paper-first idea studio. Both are already selected for this sample barrier.
- Scroll inside the dialog to Why this choice?, and paste the prepared reason.
- Click Save change. Confirm the card now says Adapted.

Show what changed

1. Original activity → adapted activity
2. The reason travels with the change

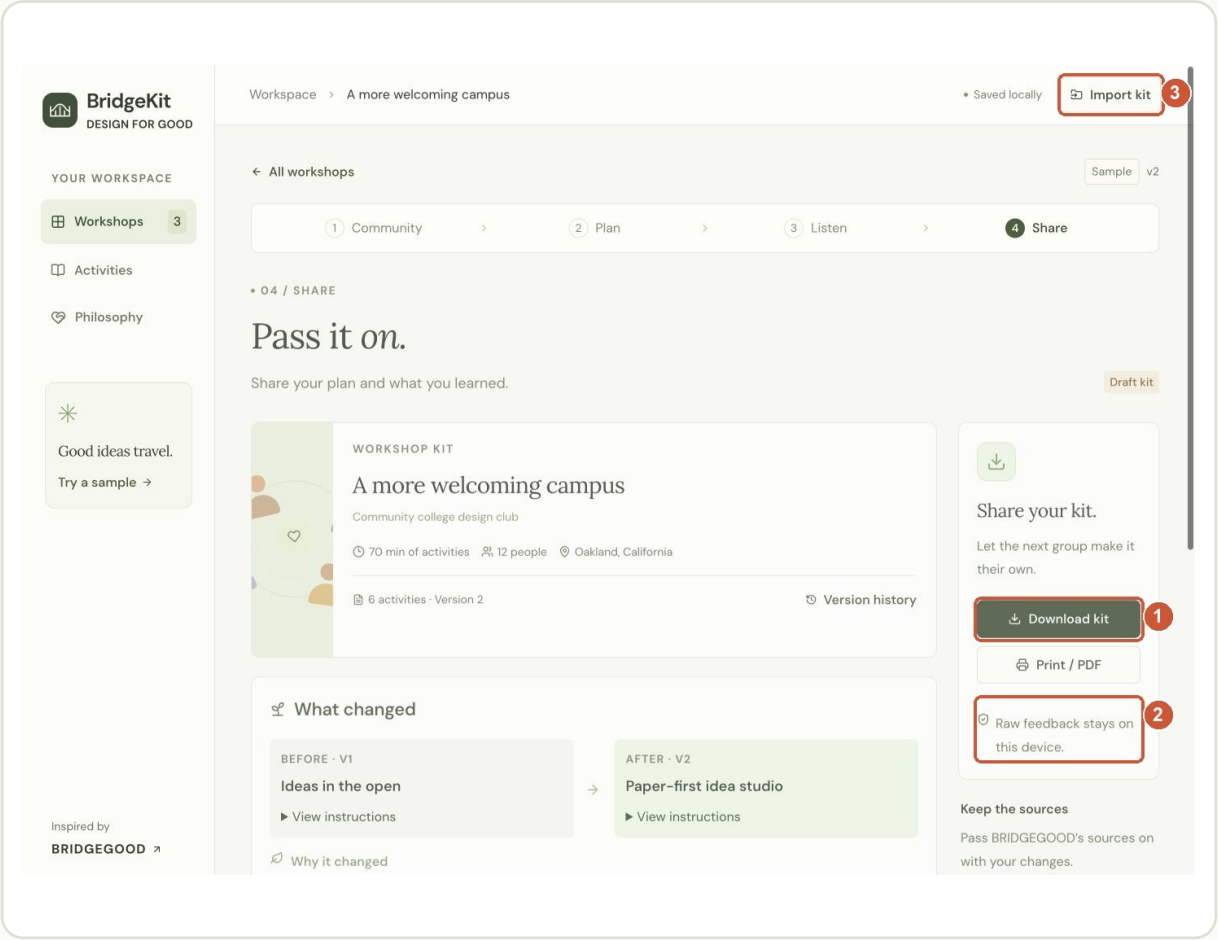

SAY

Here is the result: the digital activity becomes a paper activity, and the reason is visible beside the change. Version history keeps the original plan. We are passing on a way to make thoughtful decisions, so the next facilitator can understand the choice and respond to their own group.

CLICK / POINT

- Scroll to the step bar and click Share.
- Scroll to What changed. Point to the original activity, the paper activity, and Why it changed.
- Click Version history; point to v1 Original and v2 Feedback. Close the dialog.

Carry the learning forward

1. Download the reusable kit
2. Raw feedback stays on this device
3. Import it as a new workshop

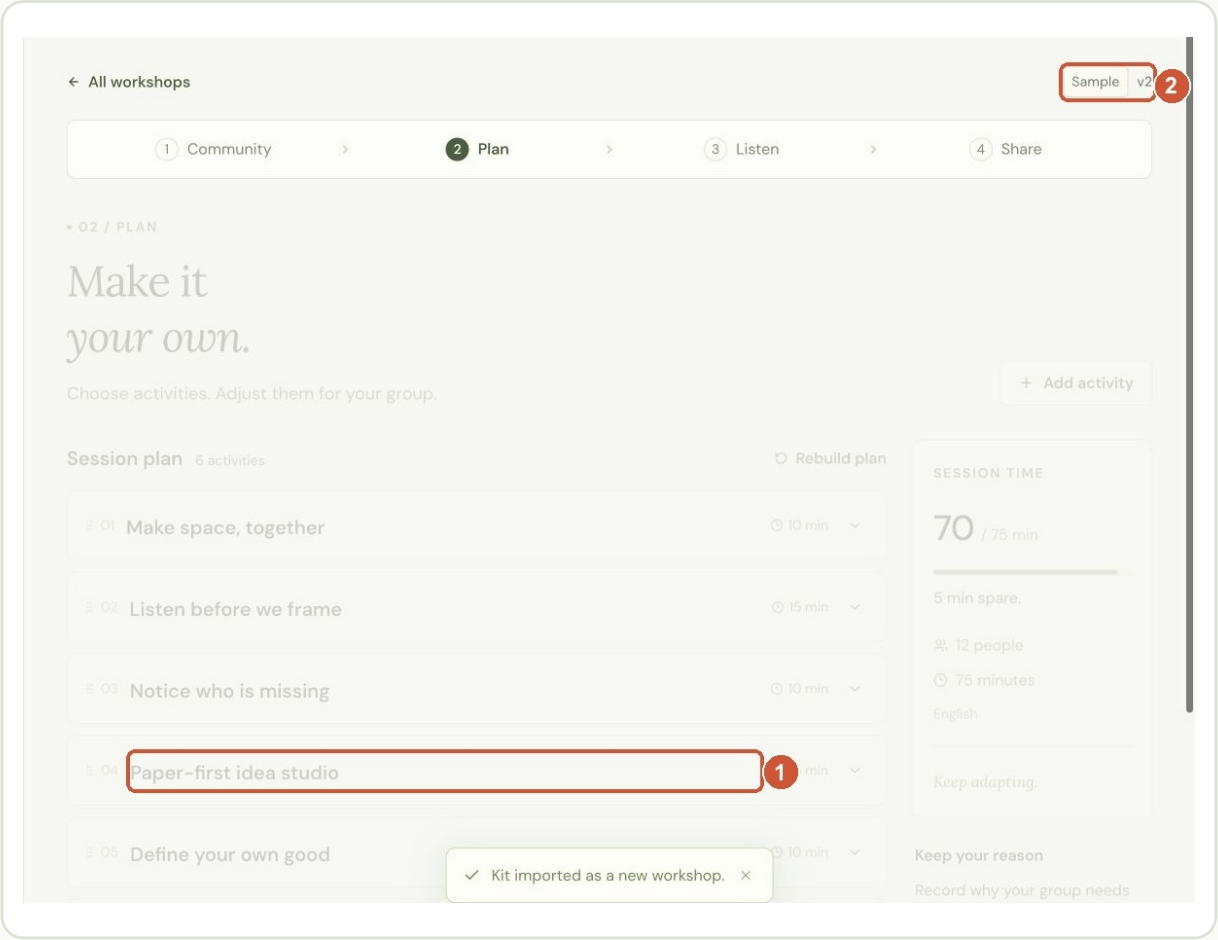

SAY

I'll download the kit and import it as a new workshop, simulating a handoff to another facilitator. The revised activity and its history come with it. Raw feedback is excluded; reasons and edited instructions still need review before sharing. The next community gets a useful starting point and room to make its own choices.

CLICK / POINT

- Scroll to Share your kit and click Download kit.
- Scroll to the top bar and click Import kit. Select the just-downloaded a-more-welcoming-campus-bridgekit JSON file; duplicate filenames may have a number suffix.
- Confirm the new workshop has Paper-first idea studio and v2. Keep the extra Listen check for Q&A if time is tight.

Close with the pilot question

1. A new workshop keeps the paper activity
2. The version history travels too

SAY

Our answer to scaling BRIDGEGOOD is to carry the mindset through decisions people can explain and improve. This is a working browser prototype with draft activities. Next, we want BRIDGEGOOD's review and a pilot testing whether a new facilitator can use a kit independently, and whether participants have meaningful ways to take part.

CLICK / POINT

- Stop clicking and look at the audience.
- Finish on the imported plan. Emphasize the next facilitator and the pilot.

Keep the ending. Be precise about the MVP.

If you fall behind

- At 2:50, move to sharing. The v1/v2 rows are enough; save opening every historical activity for Q&A.
- If the file picker stalls, close it and use the imported-plan screenshot. Say: 'This is the imported example from our rehearsal.'
- At 3:30, stop clicking and deliver the closing. Keep setup, library browsing, print dialogs, and technical details for Q&A.
- Keep the PDF and 75-second captioned demo locally available as backups.

Reset for another practice

After completing the change, click Try a sample. It opens an unadapted sample or creates one. Check v1 and the open Barrier before starting again.

Local materials

docs/presentation/guide.html The timed script, screenshots, and keyboard controls. docs/presentation/bridgekit-75s-demo.mp4 A 75-second captioned screenshot walkthrough.

Why does this address the challenge?

It connects BRIDGEGOOD's reasoning to practice, makes feedback decisions explainable, and passes that learning to another facilitator.

Is there AI or a backend?

The MVP uses deterministic planning rules and browser localStorage. Facilitators choose adaptations. Accounts, shared sessions, and cloud synchronization are future work.

What is protected when a kit is shared?

Raw reflection records are excluded, and handoff notes start excluded. Context, decision reasons, and edited activity text are shared, so facilitators review them before exporting.

What impact has been measured?

The current evidence is a working prototype and verified handoff. A pilot should test independent facilitator reuse, useful feedback decisions, and participant choice. Community outcomes have not yet been measured.

Why are two feedback items still open?

The four-minute demo completes one decision. The remaining feedback stays visible for review; the kit is an evolving draft.

Are these official BRIDGEGOOD materials?

They are draft hackathon adaptations connected to the Hack Pack. BRIDGEGOOD review is a next step.
